

Directions for Walking a Section into Place

Section legs and frames are both light and rigid enough to “walk” out into position. This can be done by one person without having to get in the water.

Step 1: Stand on edge of shore facing lake.

Step 2: Attach legs to aluminum frame at an approximate depth.

Step 3: Place the end of the section and legs into the water.

Step 4: Place your hands on the shore end of the section and tip the section to the right. In the same motion, push out toward the lake step forward. Continue on the right side, slowly rocking the dock left and right while pushing it forward. Once it is slightly farther than needed, pull it back into place and attach it to the previous section or place it on shore. If the legs need adjustment, pull the section back, adjust accordingly, and walk out into place again.

Step 5: Place three pallets of decking on the section starting at the shore and working out. As each section is added, attach the legs to the end of the existing section
